

CONTENTS

Chapter

Subject

1. QUANTUM MECHANICAL CONCEPT OF ATOMIC STRUCTURE

Subatomic particles, Thomson's model, Rutherford's model of atom, Concept of atomic number, Concept of mass number, Different nuclear structures, Electromagnetic radiation, Electromagnetic spectrum, Continuous spectrum, Atomic spectra, Spectrum of hydrogen, Maxwell's electromagnetic theory, Black body and blackbody radiation, Photoelectric effect, Compton effect, Planck's quantum theory of radiation, Bohr's atomic model, Major achievements of Bohr's model, Limitations of Bohr's model, Sommerfeld model, Electronic arrangement in orbit. Some solved problems, Some possible questions.

2. WAVE MECHANICAL CONCEPT OF ATOMIC STRUCTURE

Dual Character of matter (DEBROGLIE'S HYPOTHESIS) : Derivation of de Broglie's equation. Verification, Confirmation of Bohr's theory, Quantisation of angular momentum. Heisenberg's uncertainty principle : Illustration, Uncertainty principle and Bohr's model. Schrodinger's wave equation : Derivation, Significance of Schrodinger wave equation, Normalised wave function, Orthogonal wave function. Degeneracy, Applications of schrodinger wave equation, Transformation of cartesian coordinates to polar coordinates, Legendre polynomials, Solution of R(r) equation, Calculation of energy of hydrogen atom, Space wave function, Probability distribution of electron in an atomic orbital, Radial wave function for different orbitals, Radial probability distribution curves, Angular probability distribution for different orbitals, Differences in between orbit and orbital, Some solved problems, Some possible questions.

3. MODERN CONCEPT OF CHEMICAL BONDING

Limitations of Valence Bond theory, Molecular orbital theory; Salient features, Formation of bonding and antibonding molecular orbitals, Molecular orbitals due to combination of s-orbitals, Molecular orbitals due to combination of s- and p-orbitals, Molecular orbitals due to combination of p-orbitals, Energy level diagram for molecular orbitals, Mixing of orbitals, Electronic

Chapter	Subject
---------	---------

Configuration of molecular orbitals, Bond order, Molecular Orbital configuration of some diatomic species : H_2 , H_2^{\oplus} , He_2 , He_2^{\oplus} , C_2 , N_2 , N_2^{\oplus} , N_2^{\ominus} , O_2 , O_2^{\ominus} , O_2^{2-} , O_2^{\oplus} , F_2 , CO , NO , Metallic bonding, Some possible questions.

4. CHEMICAL KINETICS

Classification of chemical reactions, Rate of reaction, Rate equation Molecularity of a reaction. Order of a reaction, Kinetics of zero order reaction, Kinetics of first order reaction, Kinetics of second order reaction, Theories of reaction rate, Collision theory : Mathematical treatment for bimolecular reactions, Validity and limitation, Modified collision theory and its weakness, Transition state theory : Mathematical treatment, Transition state theory verses collision theory, Effect of temperature on reaction rate : Temperature coefficient, Theories explaining effect of temperature, Some solved problems, Some possible questions.

5. CATALYSIS

Introduction, Classification of catalysis, General characteristics of catalytic reactions, Promoters and their action, Catalytic poisoning, Function of catalyst, Mechanism of reaction of heterogeneous catalysts, Theories of catalysis; Intermediate compound formation theory, The adsorption theory, Quantitative treatment of adsorption theory, Enzyme catalysis : Characteristics of enzyme catalysis, Theory of enzyme catalysis, Some solved problems, Some possible questions.

6. CHEMICAL EQUILIBRIUM

Homogeneous and heterogeneous reactions, Reversible and Irreversible reactions, Law of mass action, Chemical equilibrium, Law of chemical equilibrium, Different types of equilibrium constants and their relationships, Characteristics of equilibrium constant, Equilibrium expressions of some common reactions : Formation of HI, Dissociation of PCl_5 , Manufacture of NH_3 , Combination of equilibria, Thermodynamic derivation of law of chemical

Chapter**Subject**

equilibrium, LeChatelier's principle, Applications of LeChatelier's principle. Homogenous equilibrium in liquid system. Heterogeneous equilibria, Some solved problems, Some possible questions.

7. IONIC EQUILIBRIUM

Concepts of Acids and Bases, Arrhenius theory, Bronsted-Lowry theory, Lewis theory, Some salient features of acids and bases, Dissociation of acids, Relative strengths of weak acids, Relative strengths of weak bases, Relationship between k_a and k_b , Effect of substituents on acid strength, Effect of substituents on basic strength, Ionic product of water, The concept of pH; pH scale, Importance of pH, pH of weak acids and weak bases, Buffer solution, Henderson- Hasselbach equation, Characteristics of buffers, Application of buffer solutions, Ostwald's dilution law, Common ion effect, Concept of solubility product, Relationship between solubility and solubility product, Application of solubility product principle, Some solved problems, Some possible questions.

8. CHEMICAL ENERGETICS

Free energy function, Work function, Gibb's free energy, Feasibility of a process, Gibbs Helmholtz equation and its different forms, Significance of Gibbs-Helmholtz equation, Applications of Gibbs-Helmholtz equation, Clapeyron-Clausius equation, Integrated form of Clapeyron - Clausius equation, Application of Clapeyron-Clausius equation, Van'tHoff's reaction isotherm, Van'tHoff's reaction isochore, Some solved problems, Some possible questions.

9. PHASE RULE

Phase, Component, Degrees of freedom, Phase rule, Derivation of phase rule, Phase diagram, Phase diagram of water system, Phase diagram of sulfur system, Two component system, Simple eutectic system, Silver-lead system, Zinc-cadmium system, Bismuth cadmium system, Iron-carbon system, Some solved problems, Some possible questions

10. SOLID STATE - CHEMICAL CRYSTALLOGRAPHY

Characteristics of solids, Classification of solids, Chemistry of crystals, External features of crystals, Crystal symmetry, Symmetry operations, Point groups, Elements of Crystals, Internal configuration of the crystal; Space lattice, Crystal structure, Unit cell, Bravais lattice, Lattice planes and their designation, Packing of constituents in crystals, Close packing in two dimension, Close packing in three dimension, Voids and their characteristics; Tetrahedral voids, Octahedral voids, Imperfections in crystals, Electronic imperfection, Atomic imperfection, Defects in Stoichiometric solids; Schottky defects, Frenkel defects, Defects in nonstoichiometric solids : Metal excess defects, Metal deficiency defects. Imperfection due to transient atomic displacement. Some possible questions.

11. ELECTROCHEMISTRY

Redox reactions, Electrochemical cells, Some examples of electrochemical cells, Reversible and Irreversible cells, Reversible electrodes, Electrode potential, Origin of electrode potential, Normal hydrogen electrode, Electromotive force, Measurement of EMF, Relationship between free energy change and electrical energy, Nernst equation, Nernst equation relating electrode potential and concentration, Fuel cell, Chemical cells; Chemical cell without transference, Chemical cell with transference, Determination of pH by emf measurement, Some common batteries, Corrosion, Passivity of metals, Some solved problems, Some possible questions.
